INSTALLATION AND SERVICING

IMAX XTRA EL
320-620kW

When replacing any part on this appliance, use only spare parts that you can be assured conform to the safety and performance specification that we require. Do not use reconditioned or copy parts that have not been clearly authorised by Ideal.

For the very latest copy of literature for specification and maintenance practices visit our website www.idealcommercialboilers.com where you can download the relevant information in PDF format.
GENERAL

CAUTION.
To avoid the possibility of injury during the installation, servicing or cleaning of this appliance, care should be taken when handling edges of sheet steel components.

* Electricity supply and Fuse rating for pumps etc. refer to manufacturer's instructions.

Note.
Natural gas consumption is calculated using a calorific value of 37.8MJ/m³ (10388Btu/ft³) gross or 34 MJ/m³ (910 Btu/ft³) nett at 15°C and 1013.25 mbar.

a. For l/s, divide the gross heat input (kW) by the gross C.V. of the gas (MJ/m³).

b. For ft³/h, divide the gross heat input (Btu/h) by the gross C.V. of the gas (Btu/ft³).

c. For Btu's, multiply gross heat input (kW) by 3412 (Btu).

IMPORTANT. These appliances are CE certified for safety and performance. It is, therefore, important that no external control devices, e.g. flue dampers, economisers etc., are directly connected to these appliances unless covered by these Installation and Servicing Instructions or as otherwise recommended by Ideal Boilers in writing. If in doubt please enquire.

Any direct connection of a control device not approved by Ideal Boilers could invalidate the certification and the normal appliance warranty. It could also infringe the Gas Safety Regulations and the above regulations.

HEALTH & SAFETY DOCUMENT NO. 635

The electricity at work regulations, 1989. The manufacturer's notes must NOT be taken, in any way, as overriding statutory obligations.

CAUTION. To avoid the possibility of injury during the installation, servicing or cleaning of this appliance, care should be taken when handling edges of sheet steel components.

Key to symbols

GB = United Kingdom (Countries of destination)
IE = Ireland (Countries of destination)
PMS = Maximum operating pressure of water
B23 = An appliance intended to be connected to a flue which evacuates the products of combustion to the outside of the room containing the boiler. The combustion air is drawn directly from the room. The fan is up stream of the combustion chamber.
C53 = A room sealed appliance which is connected via its separate ducts to two terminals that may terminate in zones of different pressure.
C63 = A room sealed appliance intended to be connected to a separately approved and marketed system for the supply of combustion air and discharge of combustion products. The fan is up stream of the combustion chamber. Condensate flow from the flue is not permitted back into the appliance. The maximum allowable temperature of incoming combustion air for C63 type flue is 40°C. Terminals for the supply of combustion air and for evacuation of combustion products shall not be installed on opposite walls of the building. The maximum allowable re-circulation rate is 10%.

NOTE TO THE INSTALLER: COMPLETE THE COMMISSIONING REPORT AND LEAVE THESE INSTRUCTIONS WITH APPLIANCE
INTRODUCTION

The IMAX XTRA EL boilers are fully automatically controlled, floor standing, fanned, high efficiency condensing appliances. The comprehensive boiler controls built into the appliance include:
- Volt free 'alarm' contacts (lockout)
- Volt free 'boiler run' contacts
- Burner hours run meters
- System temperatures

The boilers can draw their combustion air from the room or via ducting from outside.

Through a sophisticated control system combined with premix burner technology and an aluminium heat exchanger, the boilers are capable of high operating efficiencies and low emissions. These boilers are certified to meet the requirements of the EC Gas Appliance Directive, Boiler Efficiency Directive, EMC, Low Voltage Directive and Energy Related Products Directive.

OPTIONAL EXTRA KITS

- Modulating Sequencer Kit
  - DHW Tank Kit (used with modulating Sequencer)
  - Plant Room Sensor Kit (used with modulating Sequencer)
  - 6 Zone Expansion Kit (used with modulating Sequencer)
- Programmable Room Thermostat Kit (for use with boiler & modulating Sequencer)
- Programmable Room Thermostat Kit (for use with boiler only)
- Outside Sensor Kit
- DHW Tank Sensor Kit
- Safety Interlock Kit
- BACnet Gateway Kit
- LONWorks Gateway Kit
- MODBus Gateway Kit
- Remote Access Kit
- Pump Kit
- Sealed System Services Flow Manifold Kit
- Inlet Air Filter Kit
- Condensate Pump Kit
- Room Sealed Air Duct Kit

SAFETY

Current Gas Safety (Installation and Use) Regulations or rules in force

The appliance is suitable only for installation in GB and IE and should be installed in accordance with the rules in force.

In GB, the installation must be carried out by a GAS SAFE Registered Installer or in IE by a competent person. It must be carried out in accordance with the relevant requirements of the:
- Gas Safety (Installation and Use) Regulations
- The appropriate Building Regulations either The Building Regulations, The Building Regulations (Scotland), Building Regulations (Northern Ireland).
- The Water Fittings Regulations or Water byelaws in Scotland.
- The Current I.E.E. Wiring Regulations.

Where no specific instructions are given, reference should be made to the relevant British Standard Code of Practice.

In IE, the installation must be carried out by a Competent Person and installed in accordance with the current Building Regulations and reference should be made to the current ETCI rules for electrical installation.

The boilers have been tested and certified by BSI to EN 15502 for use with Natural Gas. Detailed recommendations are contained in the following

Standards and Codes of Practice:
- BS. 5854 - Flue and flue Structures in Buildings.
- BS. 6644 - Installation of gas fired hot water boilers of rated inputs between 70kW and 1.8MW (net) (2nd and 3rd family gases).
- BS. 6880 - Low temperature hot water heating systems of output greater than 45kW.
  - Part 1 - Fundamental and design considerations.
  - Part 2 - Selection of equipment.
  - Part 3 - Installation, commissioning and maintenance.
- IGE/UP/1 - Soundness testing and purging of industrial and commercial gas installations.
- IGE/UP/2 - Gas installation pipework, boosters and compressors on industrial and commercial premises.
- IGE/UP/10 - Installation of gas appliances in industrial and commercial premises.

SAFE HANDLING OF SUBSTANCES

No asbestos, mercury or CFCs are included in any part of the boiler or its manufacture.

FOUNDATION / LOCATION OF BOILER

The boiler must stand on a floor which must be flat, level and of a suitable load bearing capacity to support the weight of the boiler (when filled with water) and any ancillary equipment. Ideally the boiler should be placed on a plinth exceeding the plan area of the boiler by 75mm on each side and at least 100mm high.

The boiler must not be fitted outside.

GAS SUPPLY

The local gas supplier should be consulted, at the installation planning stage, in order to establish the availability of an adequate supply of gas. An existing service pipe must NOT be used without prior consultation with the local gas supplier.

A gas meter can only be connected by the local gas supplier or by a registered GAS SAFE engineer or in IE by a competent person. An existing meter should be checked, preferably by the gas supplier, to ensure that the meter is adequate to deal with the rate of gas supply required. A minimum working gas pressure of 15mbar MUST be available at the boiler inlet for Natural gas.

Do not use pipes of smaller size than the boiler inlet gas connection. The complete installation MUST be tested for gas soundness and purged in accordance with the appropriate standards.

Gas Boosters

A gas booster is required if the gas pressure available at the boiler is lower than that required by the boiler manufacturer to attain the flow rate for maximum burner input rating.

Location of the booster requires careful consideration but should preferably be closer to the burner rather than the gas meter. Ventilation should also be considered to ensure that ambient temperatures do not exceed designed recommendations. Further guidance is provided in IGE/UP/2.
FLUE INSTALLATION

IMPORTANT. It is the responsibility of the installer to ensure, in practice, that products of combustion discharging from the terminal cannot re-enter the building or any other adjacent building through ventilators, windows, doors, other sources of natural air infiltration, or forced ventilation / air conditioning.

If this should occur the appliance MUST be isolated from the gas supply and labelled as 'unsafe' until corrective action can be taken.

Terminal Position

Due to the high efficiency of the boilers pluming will occur. Vertical termination is recommended and terminal positions which could cause problems should be avoided. Particular care should be taken in the case of large output boiler installations, and complying with the requirements of the Clean Air Act.

The flue must be installed in accordance with the appropriate Building Regulations and standards listed on page 4 and in compliance with BS6644. In IE refer to I.S.820:2000.

FLUE SYSTEM DESIGN

Due to the high efficiency of these boilers, the flue gas temperatures are low and the buoyancy in the stack will be relatively small. The boiler is supplied with an integral fan which is fully matched to the boiler in each case to provide correct combustion air flow and overcome the flue resistance.

The power of this fan is such that there is a large reserve of pressure available to overcome a significant length of flue without affecting the combustion performance of the boiler. The maximum & minumum pressure available measured at the base of the flue to overcome combined flue and air resistance is 100Pa (max) and -10Pa (min) for all model sizes. The pressure should be checked at maximum heat input to ensure this maximum pressure is not exceeded. Care should be taken with tall flue systems to ensure excess buoyancy is not created. A negative pressure must not be created at the boiler flue outlet.

<table>
<thead>
<tr>
<th>Boiler Size</th>
<th>Flue Pressure (max) Pa</th>
<th>Flue Pressure (min) Pa</th>
</tr>
</thead>
<tbody>
<tr>
<td>320</td>
<td>100</td>
<td>-10</td>
</tr>
<tr>
<td>395</td>
<td></td>
<td></td>
</tr>
<tr>
<td>470</td>
<td></td>
<td></td>
</tr>
<tr>
<td>545</td>
<td></td>
<td></td>
</tr>
<tr>
<td>620</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The addition of elbows and their positions in the flue and the terminal will have a significant effect on the maximum flue length. Consult with your flue supplier for detailed design work.

IMPORTANT NOTE.

If combustion air is drawn from within the boiler room, ensure no dust or airborne debris can be ingested into the appliance. Dusty concrete flooring should be sealed to reduce the presence of dust. Ideally where possible duct the air supply into the boiler room from a clean source outside the boiler room/building.

If the air filter accessory is fitted the 100Pa / -10Pa pressure requirement must be checked at maximum heat input with the filter fitted.

Material

With no requirement for buoyancy to discharge flue products and with low flue gas temperatures, single wall flues are suitable for most installations. Care should still be taken to maintain compliance with building regulations and relevant standards.

Care should also be taken in the selection of flue terminals as these tend to accentuate the formation of a plume and could freeze in cold weather conditions.

Care should be taken to ensure the specification of the chimney is suitable for the application by reference to the manufacturer's literature.

WATER CIRCULATION SYSTEM

The boiler is suitable for connection to a sealed heating system or an open vented system.

A circulation pump MUST be connected to the boiler, see below.

The boiler must NOT be used for direct hot water supply. The hot water storage cylinder MUST be of the indirect type. Single feed, indirect cylinders are not recommended and MUST NOT be used on sealed systems.

The appliances are NOT suitable for gravity central heating nor are they suitable for the provision of gravity domestic hot water.

The hot water cylinder and ancillary pipework, not forming part of the useful heating surface, should be lagged to prevent heat loss and any possible freezing - particularly where pipes run through roof spaces and ventilated underfloor spaces.

The boiler must be vented. There must be no low points between the boiler flow connection and a system vent point, which should be positioned as close as practically possible to the boiler flow connection.

Draining taps MUST be located in accessible positions, which permit the draining of the whole system - including the boiler and hot water storage vessel. They should be at least 1/2" BSP nominal size and be in accordance with BS. 2879. Do not use the boiler drain tap to drain the system as this can induce sludge into the heat exchanger.

The central heating system should be in accordance with the relevant standards listed on page 4.

Once the burner has extinguished the boiler requires a 2 minute pump overrun to dissipate the residual heat. In order to allow this a 2 minute pump overrun is incorporated into the boiler control.

An external pump must be connected or controlled by the boiler, however if it is directly connected it must not exceed 1.3A inductive load, if it does then a relay or contactor must be used.
When sizing pumps, reference should be made to the Hydraulic Resistance Table on page 7 which show the boiler resistance against flow rates, to achieve the required temperature differential. A Pump Kit is available as an optional extra.

Flow rates for common systems using either 11°C or 20°C temperature differentials are given in the table below.

<table>
<thead>
<tr>
<th>Boiler Output (kW)</th>
<th>Water flow rate temp. difference 11°C (20°F)</th>
<th>Water flow rate temp. difference 20°C (36°F)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>l/s m/h</td>
<td>l/s m/h</td>
</tr>
<tr>
<td>320</td>
<td>6.9 24.7</td>
<td>3.8 13.7</td>
</tr>
<tr>
<td>395</td>
<td>8.6 30.9</td>
<td>4.7 17.0</td>
</tr>
<tr>

<td>11.8 42.6</td>
<td>6.5 23.5</td>
</tr>
<tr>
<td>620</td>
<td>13.5 48.8</td>
<td>7.4 26.7</td>
</tr>
</tbody>
</table>

Note.
- With the boiler firing at maximum rate, the temperature differential should not be less than 10°C. High flow rates required for lower temperature differentials could lead to erosion of the heat exchanger water ways.
- With the boiler firing at minimum rate, the temperature differential should not be greater than 35°C. Lower flow rates generating higher temperature differentials will lead to lock out of the boiler.
- The lower the return temperature to the boiler, the higher the efficiency. At return temperatures of 55°C and below, the difference becomes marked because the water in the flue gases starts to condense, releasing its latent heat.

In installations where all radiators have been provided with thermostatic radiator valves, it is essential that water circulation through the boiler is guaranteed. A mixing header will perform this task. Alternatively this can be best achieved by means of a differential pressure valve, which is installed in a bypass between the flow and return pipes. The bypass should be fitted at least 6m from the boiler, and should be capable of allowing a minimum flow rate to achieve a temperature differential of no greater than 35°C at minimum rate.

**WATER TREATMENT**

These boilers incorporate an ALUMINIUM heat exchanger.

**IMPORTANT.** The application of any other treatment to this product may render the guarantee of Ideal Boilers INVALID.

Ideal Boilers recommend Water Treatment in accordance with Guidance Notes on Water Treatment in Central Heating Systems.

If water treatment is used Ideal Boilers recommend only the use of SCALEMASTER SM-1 PRO, FERNOX, MBI, ADEY MC1, SENTINEL X100 or CALMAG CM100 inhibitors and associated water treatment products, which must be used in accordance with the manufacturers' instructions.

In hard water areas where mains water can exceed 200ppm Total Hardness (as defined by BS 7593:2006 Table 2) a scale reducing device should be fitted into the boiler cold supply within the requirements of the local water company. The use of artificially softened water, however, is not permitted.

Ideal Boilers recommend the use of Fernox Quantomat, Sentinel Combiguard, Calmag CalPhos I scale reducing devices or Scalemaster In-line Scale Inhibitor branded Ideal, which must be used in accordance with the manufacturers’ instructions.

Notes.
1. It is most important that the correct concentration of the water treatment products is maintained in accordance with the manufacturers’ instructions.

**ELECTRICAL SUPPLY**

**WARNING.** This appliance must be earthed.

Wiring external to the appliance MUST be in accordance with the current I.E.E. (BS7671) Wiring Regulations and any local regulations which apply. For Ireland reference should be made to the current ETCI rules for electrical installations.

The point of connection to the mains should be readily accessible and adjacent to the boiler.

**CONDENSATE DRAIN**

A condensate drain is provided on the boiler. This drain must be connected to a drainage point on site. All pipework and fittings in the condensate drainage system MUST be made of plastic - no other materials may be used.

**IMPORTANT.** Any external runs must be insulated to avoid freezing in cold weather causing blocking.

3 VENTILATION

The ventilation requirements of these boilers are dependant on the type of flue system used, and their heat input. All vents must be permanent with no means of closing, and positioned to avoid accidental obstructions by blocking or flooding.

Detailed reference should be made to BS. 6644 for inputs between 70kW and 1.8MW (net). In IE refer to the current edition of I.S.820. The following notes are for general guidance only:

**Dust contamination in the combustion air may cause blockage of the burner slots. Unless the boiler room provides a dust free environment then direct connection of the air intake via ducting to clean outside air should be used.**

The temperature within a boiler room shall not exceed 25°C within 100 mm of the floor, 32°C at mid height and 40°C within 100 mm of the ceiling.

**IMPORTANT NOTE.**

If combustion air is drawn from within the boiler room, ensure no dust or airborne debris can be ingested into the appliance. Dusty concrete flooring should be sealed to reduce the presence of dust. Ideally where possible duct the air supply into the boiler room from a clean source outside the boiler room/building.

---

Open Flued Installations

If ventilation is to be provided by means of permanent high and low vents communicating direct with outside air, then reference can be made to the sizes below. For other ventilation options refer to BS. 6644. In IE refer to the current edition of I.S.820.

**Required area (cm²) per kW of total rated input (net)**

<table>
<thead>
<tr>
<th></th>
<th>Boiler Room</th>
<th>Enclosure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low level (inlet)</td>
<td>4</td>
<td>10</td>
</tr>
<tr>
<td>High level (outlet)</td>
<td>2</td>
<td>5</td>
</tr>
</tbody>
</table>

Note: Where a boiler installation is to operate in summer months (e.g. DHW) additional ventilation requirements are stated, if operating for more than 50% of time (refer to BS6644).

---

4 SEALED SYSTEM REQUIREMENTS

**Working pressure 6 bar maximum.**

Particular reference should be made to BS. 6644 and Guidance note PM5 "Automatically controlled steam and hot water boilers" published by the Health and Safety Executive.

The information and guidance given below is not intended to override any requirements of either of the above publications or the requirements of the local authority, gas or water undertakings.

In general commercial closed pressurised systems are provided with either manual or automatic water make up.

In both instances it will be necessary to fit automatic controls intended to protect the boiler, circulating system and ancillary equipment by shutting down the boiler plant if a potentially hazardous situation should arise.

Examples of such situations are low water level and operating pressure or excessive pressure within the system. Depending on circumstances, controls will need to be either manual or automatic reset. In the event of a shutdown both visual and audible alarms may be necessary.

Expansion vessels used must comply with BS. 4814 and must be sized on the basis of the total system volume and initial charge pressure.

Initial minimum charge pressure should not be less than 1.0 bar (15psi) and must take account of the static head and specification of the pressurising equipment. The maximum water temperatures permissible at the point of minimum pressure in the system are specified in BSEN 61508.

When make up water is not provided automatically it will be necessary to fit controls which shut down the plant in the event of the maximum system pressure approaching to within 0.35bar (5psi) of the safety valve setting.

Other British Standards applicable to commercial sealed systems are:
- BS. 6880: Part 2
- BS. 1212
- BS. 6281: Part 1
- BS. 6282: Part 1
- BS. 6283: Part 4

**IMPORTANT:** If a sealed system is required please ensure a maximum flow temperature of 90°C is not exceeded.

---
5 OPEN VENTED SYSTEM REQUIREMENTS

Detail reference should be made to the appropriate standards listed on page 4.

The information and guidance given below is not intended to override any requirements of the above publications or the requirements of the local authority, gas or water undertakings.

The vertical distance between the pump and feed/expansion cistern MUST comply with the pump manufacturer's minimum requirements, to avoid cavitation. Should these conditions not apply either lower the pump position or raise the cistern above the minimum requirement specified by Ideal Boilers. The isolation valves should be fitted as close to the pump as possible.

The information provided is based on the following assumptions:

1. An independent open vent/safety pipe connection is made immediately after the system flow pipe connection.

2. An independent cold feed/expansion pipe connection is made immediately after the open vent/safety pipe connection.

3. The maximum flow rate through the boiler is based on a temperature difference of 20°C at full boiler output.

4. The boiler is at the highest point of circulation in the system. Systems designed to rise above the boiler flow tappings will automatically require a minimum static head higher than that shown.

5. The position of the open vent/safety pipe above the expansion cistern water level is given as a guide only. The final position will depend upon the particular characteristics of the system. Pumping over of water into the expansion cistern must be avoided.

6. Both open vent/safety pipe and cold feed/expansion pipes must be of adequate diameter to suit the output of the boiler. Refer to Tables below and BS 6644:2005.

**Open Vent Pipe Sizes**

Open vent pipe size is determined using:

\[ A = 3.5 \times Q_R \]

When:

- \( Q_R \) is heat input in kW
- \( A \) is area in \( \text{mm}^2 \)

**Cold Feed Pipe Sizes**

A minimum pipe size for the cold feed should be 50mm (bore) or 2" (DN).

Note: Steel pipe sizes complying with medium or heavy quilting or BS 1387.

**IMPORTANT:** If an open vented system is required please ensure a maximum flow temperature of 80°C is not exceeded.
## 6 BOILER ASSEMBLY - Exploded View

Note that item numbers are linked to the spares list.

TRANSPORTING & POSITIONING THE BOILER

**CAUTION**: Risk of injury through carrying heavy loads.
- Only transport the boiler by means of a crane / hoist, forklift truck or transport rollers.
- Only trained authorised personnel may undertake the handling (E.g. by forklift truck) or lifting by means of a crane/hoist.
- Observe safety instructions relating to the lifting of heavy loads (e.g. by means of a crane/hoist).
- Wear personal safety equipment (e.g. safety boots and protective gloves).
- Protect the boiler against slippage by means of a transport strap.

**NOTICE**: Boiler damage through impact.
The standard delivery of the boiler includes components that are susceptible to impact damage.
- Protect all components against impact influences when transporting the boiler.
- Observe the transport instructions on the packaging.

The boiler may be transported to the place of installation by crane/hoist, forklift truck or pallet truck, ensuring safe practice at all times. Where possible, transport the boiler to the installation location in its shipping packaging to protect it from contamination and damage.

1. **Take the boiler to the plant room via crane/hoist, forklift truck or pallet truck**.
   (*If using pallet truck refer to diagram below.*)
2. To remove the appliance from the pallet, packaging and panels MUST be removed and stored safely.
3. Remove the two screws securing the boiler to the pallet (CL front and rear).
4. Slide the unit off the pallet. At this point it can be put on transport rollers if necessary.
5. Position the boiler for installation and using a spirit level check the appliance is level to ensure no air pockets can collect in the boiler and the condensate can fully drain.
6. If the floor is not level, fit the six adjustable feet provided in the hardware pack and adjust to level the boiler. To fit the feet raise one end of the boiler and support the frame with suitable timber. Raise the other end in the same way. Fit the adjustable feet and secure.

**Note.** To remove front and side panels refer to Frame 36.

---

**NOTE. Transporting via pallet truck (side loading)**
If the appliance is required to be transported by a pallet truck from the side, it may be necessary (depending on the type of truck) to remove the two wooden lats in the middle of the pallet to aid access.

1. Remove the 4 wood screws at the side of the appliance.
2. Remove the 4 wood screws on the opposite side of the appliance.
3. Remove the 2 wooden lats.
   This will now be suitable for side loading onto a pallet truck.
8 FITMENT OF FLOW AND RETURN MANIFOLD

1. Remove front panel (refer to Frame 36) and remove hardware pack.
2. To allow fitting of the manifold extensions, remove the rear panel upper and lower by removing the 10 securing screws.
3. To fit the flow manifold extension fit the O ring seal into the recess in the rear of the flow manifold.
4. Align the flow manifold extension with the 2" BSP branch vertically upwards.
5. Insert the 6 bolts supplied in the hardware pack and fit the securing nuts. Tighten sequentially.

Note. If fitting the sealed system optional kit, please refer to the instructions supplied with the kit. If the kit is not being fitted, the 2" BSP branch must be capped off as shown in image 3.

6. The flange joint is DN80 PN6. A suitable mating flange with bolts and gaskets must be fitted to the system pipework for connection.
7. To fit the return manifold extension follow the instructions above with the exception of the ¾" BSP branch which must be aligned vertically downwards.

Note. The ¾" BSP branch may be used to fit a drain point. If this is not required the ¾" BSP branch must be capped off.

8. Once the extensions have been fitted the insulation supplied in the hardware pack must be fitted. The insulation must be secured using the wire clips supplied in the hardware pack picture.

Note. This flow manifold is fitted at the top of the appliance.
9 FLUE / AIR DUCT INSTALLATION

FLUE
When fitting the flue to the flue socket take care not to disturb the lip seal which must be present. The flue should be supported in such a way as not to place a load on the flue socket.

IMPORTANT NOTE.
Unless the flue is manufactured from aluminium the condensate from the flue must be collected and drained before entering the sump of the boiler. See page 5 for details on flue system design.

The flue adaptor supplied must be fitted & the condensate drain must be connected.

FITMENT OF THE FLUE ADAPTOR
To fit the flue adaptor apply the lubricant provided with the flue adaptor in the hardware pack around the spigot or male end of the adaptor. Offer up the adaptor with the open drain point pointing vertically downwards and push the adaptor fully home into the socket.

AIR DUCT
If it is necessary to duct the air inlet from outside, the optional air duct kit must be purchased. Instructions for installation are provided with the kit.

10 CONDENSATE DRAIN

The condensate drain must be connected to the condense drain points at the sump outlet and the flue adaptor. The condensate drain outlet must be connected to a drainage point, preferably within the building.

1. Ensure the pipe is fully located into the condensate trap.
2. Ensure the pipe is located at least half way onto the flue adaptor drain point.
3. Ensure the pipe is fully located onto the condensate trap and held in place with the clip provided.
4. The condensate trap must be secured with the bracket using the 2 screws

11 FROST PROTECTION

The boiler has built into its control system the facility to protect the boiler only against freezing.

If the boiler flow temperature $T_1$ falls below 5°C the pump and burner run until the temperature exceeds 19°C.

Central heating systems fitted wholly inside the building do not normally require frost protections as the building acts as a ‘storage heater’ and can normally be left at least 24 hours without frost damage. However, if parts of the pipework run outside the building or if the boiler will be left off for more than a day or so, then a frost thermostat should be wired into the system, see Frame 28.
12 GAS CONNECTIONS

The boiler gas supply pipe is terminated in a 2" BSP male taper connection on the top RHS of the appliance.
A minimum working gas pressure of 15mbar (6" w.g.) must be available at the boiler inlet with the boiler firing.
Fit a gas supply pipe NOT LESS THAN 2" BSP to the boiler. Refer to Frame 2.

It is recommended that an isolation valve be fitted as close to the boiler as possible.

| Pressure drop from appliance inlet to gas valve inlet test point |
|----------------------|-----------------|-----------------|-----------------|-----------------|------------------|
|                      | 320             | 395             | 470             | 545             | 620              |
| Max Rate (mbar)      | 0.6             | 0.5             | 1.0             | 1.5             | 1.5              |
| Min Rate (mbar)      | 0               | 0               | 0               | 0               | 0               |

13 ELECTRICAL CONNECTIONS

Warning. This appliance MUST be efficiently earthed.
A mains supply of 230V 50Hz @ 7A is required. The supply wiring MUST be suitable for mains voltage.
Connection should be made in a way that allows complete isolation of the electrical supply - such as a double pole switch, having a 3mm (1/8") contact separation in both poles serving only the boiler and system controls. The means of isolation must be accessible to the user after installation.

When making mains electrical connections to the boiler it is important that the wires are prepared in such a way that the earth conductor is longer than the current carrying conductors, such that if the cord anchorage should slip the current carrying conductors become taut before the earthing conductor.
Two plastic conduit tubes are provided, to allow routing from the installation connections on the front of the boiler to the rear egress point.
One conduit should be used for 230V mains wires and one for SELV wiring.

14 EXTERNAL WIRING

External wiring MUST be in accordance with the current I.E.E. (BS7671) Wiring Regulations. For Ireland reference should be made to the current ETCI rules for electrical installations.
For wiring external controls to the boiler, reference should be made to the systems wiring diagram supplied by the relevant manufacturer in conjunction with the connection diagram shown in Frame 17.
Difficulty in wiring should not arise, providing the following directions are observed:

1. The appliance must be wired with a permanent live supply. External controls should NOT be wired in series with this mains input. Controlling the mains input in this way will prevent the pump over-run sequence and may cause damage to the heat exchanger.
2. 230V AC outputs are provided and may be used to control pumps or valves as required. They may also be used to provide status signals into any external BMS. The function of these outputs can be set in order to meet the function required by the system.
3. 230V AC inputs are provided to enable the following demands:
   - Two heating demand inputs.
   - One Heating and One Hot water demand input.
4. SELV inputs are provided to enable the following demands:
   - Volts free input (OpenTherm)
   - 0-10V input
   - Outside Sensor
   - Hot water tank thermistor
5. An OpenTherm control Bus is provided to enable control and monitoring of the boiler by:
   - Modulating sequencer Kit
   - OpenTherm Room Control
   - OpenTherm Compatible BMS
   - OpenTherm Gateway
     - BACNET
     - MODBUS
     - LONWORKS
6. Volts free contacts are provided for the following:
   - Burner On
   - Fault
7. An optional outside temperature sensor may be fitted for outside weather compensation. See Frame 17 for connection details.
8. A Safety Interlock Kit may be fitted to the boiler if required.
15 MAINS AND CONTROL WIRING

Remove the two securing screws from the left hand side of the Installer connection cover.

From the rear of the appliance, feed the wiring for the electrical supply and controls into the two wiring conduits. All mains voltage cabling must be fitted using the LH conduit as seen from the rear. All extra low voltage cables must be fitted using the RH conduit.

The 230VAC electrical supply is connected to the 3 pin connector block. Refer to diagram in Frame 17. All cables must be retained in the cable clamps or glands provided.

16 SEQUENCER CONTROL OF MULTIPLE BOILERS

In installations where the heat load is greater than the boiler capacity an ideal solution is to use multiple boiler arrangements.

The ideal way to control a multiple boiler installation is with our modulating sequencer.

See below a typical installation example with our modulating sequencer kit. This device is capable of controlling up to 5 boilers. Additional kits are required for greater than this up to a maximum of 20 boilers.

**Legend**

1. Non-return valve
2. Safety valve
3. Service valve
4. Mixing header
5. System pump
6. Modulating Sequencer kit complete with outdoor sensor and flow sensor
7. Drain cock
8. Shunt pump
9. Room Sensor

**EXAMPLE**
1. If a Pump is to be run directly from the boiler and the electrical current draw is 1.3A inductive or less then the pump can be connected directly into the CH Pump or DHW Pump connections, as appropriate. If the current draw is more than this then an external relay or contactor should be operated by the CH Pump or DHW Pump connection, with the external contact then powering the pump.

2. The Lockout Volt Free Relay contacts will close 4 minutes after a Fault occurs.

3. The Burner On Volt Free Relay contacts will close when the Burner is on.

4. Only Ideal Outside Sensor and DHW Tank Sensor kits should be connected to the boiler.

5. The External Interlock connection is only used in conjunction with the External Interlock Kit. This can be configured for 230V or 24V operation.

6. The Volts Free contacts can also be used for 230V or 24V signalling circuits.
19 BASIC CONTROLS DISPLAY

IMAX XTRA EL USER INTERFACE

Mains On
When the mains to the boiler is switched on a screen similar to the following will be displayed.

Standby Mode
If the boiler has been switched to Standby Mode the following screen will be displayed.
No Boiler operation will take place with this setting. See Frame 21 to change to Summer or Winter setting.

Summer Mode
If the boiler has been switched to Summer Mode a screen similar to the following will be displayed.
Domestic Hot Water operation will take place with this setting but Central Heating will not. See Frame 21 to enable Central Heating by changing to Winter setting.

Winter Mode
If there is no current Heat Demand a screen similar to the following will be displayed.
Line 5 indicates “Switched Live” or “OpenTherm” or “0-10V” depending on which controls are connected to the boiler.

Domestic Hot Water Mode (DHW Thermostat)
If there is an ongoing Domestic Hot Water Demand using a DHW Thermostat, screens similar to the following will be displayed.
Line 2 indicates whether Switched Live or OpenTherm is controlling the boiler.
Line 3 indicates the current operating State (Pre-Purge or Ignition or Burner On or Pump Overrun).
Burner Power and Flow Temperature will vary as the boiler operates.

Domestic Hot Water Mode (DHW Thermistor)
If there is an ongoing Domestic Hot Water Demand using a DHW Thermistor, screens similar to the following will be displayed.
Line 2 indicates whether Switched Live or OpenTherm is controlling the boiler.
Line 3 indicates the current operating State (Pre-Purge or Ignition or Burner On or Pump Overrun).
Burner Power and Hot Water Temp’ will vary as the boiler operates.
See Frame 21 for adjusting DHW Setpoint
See Frame 21 for configuring the boiler to use a DHW Thermistor.

continues . . . . . .
20 BASIC CONTROLS DISPLAY CONTINUED......

Central Heating Mode
If there is an ongoing Central Heating Demand screens similar to the following will be displayed.
Line 2 indicates whether Switched Live or OpenTherm is controlling the boiler.
Line 3 indicates the current operating State (Pre-Purge or Ignition or Burner On or Pump Overrun).
Outside temperature will only be shown if an outside sensor is connected to the boiler.
Burner Power and Flow Temp will vary as the boiler operates

Central Heating
- Central Heating
- CH Switched Live On
- Burner On
- Flow Setpoint 80°C
- Flow Temp 80°C

Boiler Frost Protection Mode
If the boiler flow temperature drops below 5°C screens similar to the following will be displayed.
Line 3 indicates the current operating State (Pre-Purge or Ignition or Burner On or Pump Overrun).
Outside temperature will only be shown if an outside sensor is connected to the boiler.
Burner Power and Flow Temp will vary as the boiler operates.

Boiler Frost Protect
- Burner Power 100%
- Burner On
- Frost Setpoint 5°C
- Flow Temp 80°C

System Frost Protection Mode
If an Outside Sensor is fitted and the Outside Temperature drops below the system frost protection temperature setpoint a screen similar to the following will be displayed.
Line 3 indicates the current operating State (Pre-Purge or Ignition or Burner On or Pump Overrun)
Flow Temperature and Outside Temperature will vary as the boiler operates.
See Frame 25 for adjusting the system frost protection temperature setpoint.

System Frost Protect
- Flow Temp 80°C
- Burner On
- Frost Setpoint -10°C
- Outside Temp' 10°C

Cylinder Frost Protection Mode
If a Domestic Hot Water Thermistor is connected to the boiler and the DHW temperature drops below 5°C a screen similar to the following will be displayed.
Line 3 indicates the current operating State (Pre-Purge or Ignition or Burner On or Pump Overrun).
Burner Power, Hot Water Temp' and Outside Temp' will vary as the boiler operates.
Outside temperature will only be shown if an outside sensor is connected to the boiler.

Cylinder Frost Protect
- Burner Power 100%
- Burner On
- Frost Setpoint 5°C
- Hot Water Temp' 4°C

0-10V Capacity Operating Mode
If 0-10V Capacity operation is ongoing screens similar to the following will be displayed.
Line 3 indicates the current operating State (Pre-Purge or Ignition or Burner On or Pump Overrun).
Flow Temp' and Burner Power will vary as the boiler operates
0-10V Input and Burner Setpoint Target will vary as the external Building Management System controls them.
See Frame 23 for configuring the boiler for 0-10V Capacity Operation.

0-10V Operation
- 0-10V Input = 10.0V
- Burner On
- Burner Setpoint Target 100%
- Flow Temp 80°C

0-10V Temperature Operating Mode
If 0-10V Temperature operation is ongoing screens similar to the following will be displayed.
Line 3 indicates the current operating State (Pre-Purge or Ignition or Burner On or Pump Overrun).
Flow Temp and Burner Power will vary as the boiler operates
0-10V Input and Flow Setpoint will vary as the external Building Management System controls them.
See Frame 23 for configuring the boiler for 0-10V Temperature Operation.

0-10V Operation
- 0-10V Input = 10.0V
- Burner On
- Flow Setpoint 80°C
- Flow Temp 80°C

continued . . . . . .
21 IMAX XTRA EL USER INTERFACE - BASIC OPERATING INSTRUCTIONS

SETTING FLOW TEMPERATURE
Press SELECT and a screen similar to the following will be displayed. The kW output number in the 1st line will vary depending on the maximum output of the boiler.

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Operation</td>
</tr>
<tr>
<td>Set Flow Temp'</td>
</tr>
<tr>
<td>Set DHW Temp'</td>
</tr>
</tbody>
</table>

Rotate the KNOB clockwise until a screen similar to the following is displayed.

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Operation</td>
</tr>
<tr>
<td>Set Flow Temp'</td>
</tr>
<tr>
<td>Set DHW Temp'</td>
</tr>
</tbody>
</table>

Press SELECT and a screen similar to the following will be displayed.

<table>
<thead>
<tr>
<th>Set Flow Temp'</th>
</tr>
</thead>
<tbody>
<tr>
<td>80°C</td>
</tr>
</tbody>
</table>

Press + and - to change to the required setting and then press ENTER to store. Rotate the KNOB anti-clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

SETTING DOMESTIC HOT WATER TEMPERATURE
Note that DHW Temperature can only be set if a DHW Thermistor has been connected to the boiler and the boiler configured for its use. Without a DHW thermistor the flow temperature for the DHW switched live input will be controlled to the DHW Temperature Setpoint +4°C.

Press SELECT and a screen similar to the following will be displayed. The kW output number in the 1st line will vary depending on the maximum output of the boiler.

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Operation</td>

<tr>
<td>Set DHW Temp'</td>
</tr>
</tbody>
</table>

Rotate the KNOB clockwise until a screen similar to the following is displayed.

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Operation</td>
</tr>
<tr>
<td>Set DHW Temp'</td>
</tr>
<tr>
<td>Set Off/Sum/Win</td>
</tr>
</tbody>
</table>

Press SELECT and a screen similar to the following will be displayed.

<table>
<thead>
<tr>
<th>Set DHW Temp'</th>
</tr>
</thead>
<tbody>
<tr>
<td>65°C</td>
</tr>
</tbody>
</table>

Press + and - to change to the required setting and then press ENTER to store. Rotate the KNOB anti-clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

SETTING SUMMER, WINTER AND STANDBY OPERATION
Note that Standby Mode will disable Domestic Hot Water and Central Heating. Summer Mode will disable Central Heating.

Press SELECT and a screen similar to the following will be displayed. The kW output number in the 1st line will vary depending on the maximum output of the boiler.

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Operation</td>
</tr>
<tr>
<td>Set Flow Temp'</td>

</tbody>
</table>

Rotate KNOB clockwise until a screen similar to following is displayed.

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set DHW Temp'</td>
</tr>
<tr>
<td>Set Off/Sum/Win</td>
</tr>
</tbody>
</table>

Press SELECT and a screen similar to the following will be displayed.

<table>
<thead>
<tr>
<th>Set Off/Sum/Win</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standby</td>
</tr>
<tr>
<td>Summer</td>
</tr>
<tr>
<td>Winter</td>
</tr>
<tr>
<td>Press - for more</td>
</tr>
</tbody>
</table>

Press + and - to change to required setting, press ENTER to store. Rotate the KNOB anti-clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

SETTING THE OUTSIDE SENSOR SLOPE
Note that an Outside Sensor must be fitted to the boiler for this feature to be active (this will be detected automatically).

Press SELECT and a screen similar to the following will be displayed. The kW output number in the 1st line will vary depending on the maximum output of the boiler.

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Operation</td>
</tr>
<tr>
<td>Set Flow Temp'</td>
</tr>
<tr>
<td>Set DHW Temp'</td>
</tr>
</tbody>
</table>

Rotate KNOB clockwise until a screen similar to the following is displayed.

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set Off/Sum/Win</td>
</tr>
<tr>
<td>Out' Sensor Slope</td>
</tr>
</tbody>
</table>

Press SELECT and a screen similar to the following will be displayed.

<table>
<thead>
<tr>
<th>Out' Sensor Slope</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.5</td>
</tr>
</tbody>
</table>

Note that a higher number gives a higher room temperature and a lower number gives a lower room temperature. Press + and - to change to required setting, press ENTER to store. Rotate the KNOB anti-clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.
VIEWING THE STATE OF THE BOILER INPUTS

Press SELECT and a screen similar to the following will be displayed.
The kW output number in the 1st line will vary depending on the maximum output of the boiler.

Ideal imax XL 320 kW
Normal Operation
Set Flow Temp'
Set DHW Temp'

Rotate KNOB clockwise until a screen similar to the following is displayed.

Ideal imax XL 320 kW
Out’ Sensor Slope
State of Inputs
State of Outputs
Fault History

Press SELECT and a screen similar to the following will be displayed.

State of Inputs
Flow Temp’ 80°C
Return Temp’ 60°C
HX Temperature 70°C
Press - for more

The state of the inputs will vary as the boiler operates.
Press SELECT to exit this option.
Rotate the KNOB anti-clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

VIEWING THE STATE OF THE BOILER OUTPUTS

Press SELECT and a screen similar to the following will be displayed.
The kW output number in the 1st line will vary depending on the maximum output of the boiler.

Ideal imax XL 320 kW
Normal Operation
Set Flow Temp'
Set DHW Temp'

Rotate KNOB clockwise until a screen similar to the following is displayed.

Ideal imax XL 320 kW
State of Inputs
Fault History
Show Hours Run

Press SELECT and a screen similar to the following will be displayed.

State of Outputs
Boiler Pump On
DHW Pump/Valve Off
Fan 3000rpm
Press - for more

The state of the outputs will vary as the boiler operates.
Press SELECT to exit this option.
Rotate the KNOB anti-clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

VIEWING THE FAULT HISTORY OF THE BOILER

Press SELECT and a screen similar to the following will be displayed.
The kW output number in the 1st line will vary depending on the maximum output of the boiler.

Ideal imax XL 320 kW
Normal Operation
Set Flow Temp'
Set DHW Temp'

Rotate KNOB clockwise until a screen similar to the following is displayed.

Ideal imax XL 320 kW
Fault History
Show Hours Run
Normal Operation

Press SELECT and a screen similar to the following will be displayed.

Fault History: Max 10
Fault 1 [Latest]
Ignition Lockout [16]
23 days ago
Press - for more

The Fault History will vary depending on the operation of the boiler.
Press SELECT to exit this option.
Rotate the KNOB anti-clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

VIEWING THE BOILER HOURS RUN

Press SELECT and a screen similar to the following will be displayed.
The kW output number in the 1st line will vary depending on the maximum output of the boiler.

Ideal imax XL 320 kW
Normal Operation
Set Flow Temp'
Set DHW Temp'

Rotate KNOB clockwise until a screen similar to the following is displayed.

Ideal imax XL 320 kW
Fault History
Show Hours Run
Normal Operation

Press SELECT and a screen similar to the following will be displayed.

Show Hours Run
Total Hours 20 h
Flame On 10 h

The times will vary depending on the operation of the boiler.
Press SELECT to exit this option.
Rotate the KNOB anti-clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

<tr>
<td></td>
<td>Soft Start Time</td>
</tr>
</tbody>
</table>

Press SELECT and the following screen will be displayed

<table>
<thead>
<tr>
<th>Set Min Flow Temp’</th>
</tr>
</thead>
<tbody>
<tr>
<td>30°C</td>
</tr>
</tbody>
</table>

Press + and - to change to the required setting and then press ENTER to store.

Rotate the KNOB clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

CHANGING THE SYSTEM FROST PROTECTION TEMP. SETPOINT

Note that System Frost Protection Function is only operational if an Outside Sensor has been connected.

The CH pump is switched on if the Outside Temp. is less than the System Frost Protection Temp.

The CH pump is switched off if the Outside Temp. is more than the System Frost Protection Temp. +5°C.

The boiler default setting is that the system frost protection temp. setpoint is -2°C.

Press SELECT and then hold + and - down together for more than 5s, the following screen will be displayed.

<table>
<thead>
<tr>
<th>Installer Mode</th>
<th>Normal Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Set Flow Temp’</td>

<tr>
<td></td>
<td>Soft Start Time</td>
</tr>
</tbody>
</table>

Press SELECT and the following screen will be displayed

<table>
<thead>
<tr>
<th>Sys Frost Protect</th>
</tr>
</thead>
<tbody>
<tr>
<td>-10°C</td>
</tr>
</tbody>
</table>

Press + and - to change to the required setting, press ENTER to store.

Rotate the KNOB clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

Note: if this menu option is not displayed then the “2nd sL DHW/CH2” menu option has been set for CH. CH Priority can be set from the “2nd sL DHW/CH2” menu option or the 2nd sL can be reconfigured for DHW operation.

Installation

continued . . . . . . .
26 IMAX XTRA EL USER INTERFACE - ADVANCED OPERATING INSTRUCTIONS CONTINUED

CHANGING THE SOFT START TIME
The Soft Start Time is the time for which the boiler will run at the ignition rate after a flame is detected.
This feature helps make the boiler fully compatible with the CH/DHW system. The default Soft Start time is 5s.
Care should be taken in adjusting this feature as system noise and/or boiler lockout could occur.
Press SELECT and then hold + and - down together for more than 5s, the following screen will be displayed.

Press + and - to change to required setting then press ENTER to store.
Rotate the KNOB clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.
Note that the minimum setpoint after adjustment is 60s
The recommended minimum is 120s.

ENABLING THE DOMESTIC HOT WATER THERMISTOR
The default is for a DHW Heat Demand to be indicated by a DHW Thermostat providing a 230V input to the DHW Switched Live
Instead a DHW Thermistor, available as a kit from Ideal, can be connected to the DHW Thermistor input.
Rotate the KNOB clockwise until the following screen is displayed.

Press + and - to change to the required setting and then press ENTER to store.
Rotate the KNOB clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

CHANGING THE NOMINAL ROOM TEMPERATURE ACHIEVED DURING OUTSIDE SENSOR OPERATION (O/S ROOM TEMP')
Note that the O/S Room Temp' Function is only operational if an Outside Sensor has been connected.
The O/S Room Temp' is the notional room temperature that the boiler will try to achieve under Weather Compensation operation
The default O/S Room Temp' is 20°C.
Press SELECT and then hold + and - down together for more than 5s, the following screen will be displayed.

Press + and - to change to required setting, press ENTER to store.
Rotate the KNOB clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

continued . . . . .
**REVERTING TO FACTORY SETTINGS**

Press SELECT, hold + and - together for more than 5s, the following screen will be displayed:

**Installer Mode**

**Normal Operation**
- Set Flow Temp'
- Set DHW Temp'

Rotate the KNOB clockwise until the following screen is displayed:

**Installer Mode**

**DHW Sensor**

**Factory Settings**
- Anti-Legion Temp'
- Anti-Legion Enable

Press SELECT and the following screen will be displayed:

**Factory Settings**

**Reset?**

Press ENTER and a screen similar to the following will be displayed:

**Factory Settings**

Are you sure?
- Press Enter to Reset
- Press Select not to Reset

Press ENTER and a screen similar to the following will be displayed:

**Factory Settings**

Are you sure?
- Press Enter to Reset
- Press Select not to Reset

Press Select then Rotate the KNOB clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

**CHANGING THE ANTI-LEGIONELLA TEMPERATURE**

Note Anti-Legionella Temp. Function is only operational if a DHW Thermistor has been connected. Care should be taken reducing this temp. as unsafe conditions could result. Press SELECT and then hold + and - down together for more than 5s, the following screen will be displayed:

**Installer Mode**

**Normal Operation**
- Set Flow Temp'
- Set DHW Temp'

Rotate the KNOB clockwise until the following screen is displayed:

**Installer Mode**

**DHW Sensor**

**Factory Settings**
- Anti-Legion Temp'
- Anti-Legion Enable
- BUS Address
- Flame/Damper

Press SELECT and the following screen will be displayed:

**Factory Settings**

Are you sure?
- Press Enter to Reset
- Press Select not to Reset

Press ENTER and a screen similar to the following will be displayed:

**Factory Settings**

Are you sure?
- Press Enter to Reset
- Press Select not to Reset

Press Select then Rotate the KNOB clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.

**DISABLING THE ANTI-LEGIONELLA FUNCTION**

Note that the Anti-Legionella Temperature Function is only operational if a Domestic Hot Water Thermistor has been connected. Care should be taken in disabling this function as an unsafe condition could result.

Press SELECT and then hold + and - down together for more than 5s, the following screen will be displayed:

**Installer Mode**

**Normal Operation**
- Set Flow Temp'
- Set DHW Temp'

Rotate the KNOB clockwise until the following screen is displayed:

**Installer Mode**

**Anti-Legion Temp**

**Anti-Legion Enable**

**BUS Address**

**Flame/Damper**

Press SELECT and the following screen will be displayed:

**Anti-Legion Enable**

On

Off

Press + and - to change to required setting then press ENTER to store. Rotate the KNOB clockwise until Normal Operation is highlighted again and press SELECT to return to normal operation.
28 IMAX XTRA EL WITH EXTERNAL CONTROLS
VIA SWITCHED LIVE, 0-10V INPUT OR OPENTHERM

Note that the boiler requires a 2 minute pump overrun period. The boiler warranty will be invalid if this is not provided.

It is recommended that the pump overrun functionality is achieved by connecting the pump or pump control to the boiler CH Pump connections (see diagram), although this functionality can be replicated with external controls (for example a Building Management System).

If the CH Pump connection is used and the electrical current draw is 1.3A inductive or less then the pump may be connected directly into the CH Pump connection.

If the current draw is more than this then an external relay or contactor should be operated by the CH Pump connection, with the external relay then powering the pump.

---

EXTERNAL CONTROLS - VIA SWITCHED LIVE

---

EXTERNAL CONTROLS - VIA 0-10V INPUT

---

EXTERNAL CONTROLS - VIA OPENTHERM
29 COMMISSIONING AND TESTING

A. ELECTRICAL INSTALLATION

1. Checks to ensure electrical safety should be carried out by a competent person.
2. ALWAYS carry out the preliminary electrical system checks, i.e. earth continuity, polarity, resistance to earth and short circuit, using a suitable meter.
3. From turning the power on the fan will run for 4.5mins if in standby mode.

B. GAS INSTALLATION

1. The whole of the gas installation, including the meter, should be inspected and tested for soundness and then purged in accordance with the recommendations of the relevant standards listed on page 4, by the installer. In IE refer to I.S.813:2002.

Pressure drop from appliance inlet to gas valve inlet test point

<table>
<thead>
<tr>
<th></th>
<th>320</th>
<th>395</th>
<th>470</th>
<th>545</th>
<th>620</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max Rate (mbar)</td>
<td>0.6</td>
<td>0.5</td>
<td>1.0</td>
<td>1.5</td>
<td>1.5</td>
</tr>
<tr>
<td>Min Rate (mbar)</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Note. Minimum GAS inlet pressure of 15 mbar

WARNING. Whilst effecting the required gas soundness test and purging air from the gas installation, open all windows and doors, extinguish naked lights and DO NOT SMOKE.

30 INITIAL LIGHTING

1. Check that the system has been filled and the boiler is not air locked - air in the boiler could damage the heat exchanger.
2. Check that all the drain cocks are closed and any valves in the flow and return are open.
3. Check that the GAS SERVICE COCK IS ON.
4. Fill the condensate trap with water before putting the unit into operation (see Frame 49 for condensate trap removal).
5. Check the indication on the pressure gauge. If the system pressure is less than 1 bar the installation should be filled up first.
6. Switch the electricity supply ON and check that all the external controls are calling for heat. Check boiler is set for winter operation - see IMAX XTRA EL user interface basic operating instructions.
7. The boiler will commence the ignition sequence. If after 5 attempts the boiler has failed to light then it will lock out. Press the reset button to restart the ignition sequence.
8. Fit a flue sampling probe on the flue adapter after ignition, refer to Page 5.
9. Operate the boiler at max rate for 10 mins (refer to Table 1) and check the gas rate if a meter is available. This should be at least 90% of the nominal. (Refer to Frame 35).
10. Check the CO2% level at max, referring to Table below. Then check the CO2% level at min.

IMAX XTRA EL ~ Flue CO2 % measurements (hot condition)

<table>
<thead>
<tr>
<th></th>
<th>320</th>
<th>395</th>
<th>470</th>
<th>545</th>

<td></td>
<td></td>
</tr>
<tr>
<td>Min Rate* (20%)</td>
<td>9.0% (±0.5%)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

* When testing Max & Min Rates; Ensure the controls display shows 100% or 20% burner power respectively.

ADJUSTING THE CO2%

Note. Turning the Throttle and Offset anti clockwise will increase the CO2. Turning the Throttle and Offset clockwise will decrease the CO2.

If the CO2% is outside of these limits, the gas valve needs to be adjusted. If the max CO2 % needs adjustment, this is altered by the throttle screw on the front of the gas valve.

If the min CO2% need adjustment, this is altered by the offset screw. When making CO2 adjustments, the max must be checked or adjusted BEFORE checking and if necessary adjusting the min CO2.

Once the CO2 has been set, check the CO/CO2 ratio. This must not exceed 0.004. If the CO/CO2 ratio is above 0.004 and the CO2 levels at max and min are correct, switch off the appliance and contact Ideal Boilers.

Refer to Frame 35, Servicing Schedule.

32 GENERAL CHECKS

Make the following checks for correct operation.

1. The correct operation of ANY secondary system controls should be proved. Operate each control separately and check that the main burner or circulating pump, as the case may be, responds.

2. Water circulation system;
   a. With the system HOT examine all water connections for soundness.
   b. With the system still HOT, turn off the gas, water and electricity supplies to the boiler and drain down to complete the flushing process.
   c. Refill and vent the system, clear all air locks and again check for water soundness.
   d. Balance the system.

3. Check the condensate drain for leaks and check it is discharging correctly.

4. Finally set the controls to the User’s requirements.

Note. If an optional programmer kit is fitted then refer to the instructions supplied with the kit.

33 HANDING OVER

ROUTINE OPERATION

Draw the attention of the boiler owner or his representative to the User Guide. Give a practical demonstration of the lighting and shutting down of the boiler.

Describe the function of the boiler and system controls and show how they are adjusted and used.

Hand these Installation and Servicing/User’s Instructions and to the customer and request him to keep them in a safe place for ready reference. For IE, it is necessary to complete a “Declaration of Conformity” to indicate compliance to the appropriate standard.

IMPORTANT. Point out to the owner that the boiler must have regular maintenance and cleaning, at least annually, in order to ensure reliable and efficient operation. Regular attention will also prolong the life of the boiler and should preferably be performed at the end of the heating season.

After installation and commissioning please complete the Commissioning Sheet, at the rear of this book, before handover to the customer. For IE, it is necessary to complete a “Declaration of Conformity” to indicate compliance to I.S. 813:2002.

Recommend that a contract for this work should be made with the regional gas authority or a Gas Safe Registered Engineer. In IE servicing work must be carried out by a competent person.
**34 SAFETY**

It is the law that any service work must be carried out by a Gas Safe Registered Engineer. In IE service work must be carried out by a competent person.

**WARNING.** Always turn off the gas supply at the gas service cock, and switch off and disconnect the electricity supply to the appliance and any external controls before servicing or replacing components.

To replace parts in the water circuit, it will be necessary to isolate the water and drain the boiler.

**NOTE.**

*When the burner switch is in the off position the boiler control module remains live.*

**IMPORTANT.**

After completing the servicing or replacement of components always:

- Test for gas soundness.
- Check the water system is correctly filled and free of air. Air in the boiler could cause damage to the heat exchanger.
- Check the jacket front panel is correctly fitted. Fit the controls cover in place.
- With the system hot examine all water connections for soundness.
- Check the gas rate and measure the combustion CO/CO₂ content. The CO₂/CO ratio of the flue gas should not be greater than 0.004 ratio and the CO₂ should match the values given in Frame 30.
- Carry out functional checks as appropriate.
- Ensure the boiler has adequate ventilation for any gas remaining within uninsulated pipework.

**Note.** *When undertaking any servicing or replacement of parts it is essential that any gasket or seal is checked for signs of wear or damage and is replaced as necessary.*

---

**35 SERVICING SCHEDULE**

To ensure the continued safe and efficient operation of the appliance it is recommended that it is checked at regular intervals and serviced as necessary. The frequency of servicing will depend upon the installation condition and usage but should be carried out at least annually.

**Ideal Boilers** does not accept any liability resulting from the use of unauthorised parts or the repair and servicing of appliances not carried out in accordance with the Company’s recommendations and specifications.

**Note.**

*Some aluminium oxide build-up within the heat exchanger assembly is quite normal with this type of condensing boiler. Though removal and cleaning is recommended annually, the heat exchanger, sump and condensate trap must be inspected and cleaned after a maximum of 2 years operation.*

1. Light the boiler and carry out function checks, noting any operational faults.
2. Run the boiler for 10 minutes and then check the gas consumption rate. Refer to procedure opposite on how to force the burner to maximum rate.
3. Connect a suitable gas analyser to the sampling point fitted in the flue adapter. For correct boiler operation the CO₂/CO ratio of the flue gas should not be greater than 0.004 ratio and the CO₂ values should match those in table 1. If this is the case the gas input is at least 90% of the nominal.
4. Remove and clean the burner. Refer to Frame 38.
5. Inspect the heat exchanger through the burner opening. If there are signs of aluminium oxide build up, spray water down the flueways. Refer to Frame 38.
6. Remove the sump cover and scrape out any deposits. Refer to Frame 41.
7. Remove the condensate trap and flush through with water. Refer to Frame 42.
8. Check that the flue terminal is unobstructed and that the flue system is sealed correctly.
9. Remove the gas valve filter and check that there is no debris. Clean or replace as necessary. Refer to Frame 40.
10. Whilst burner is removed, ensure spark gap between electrodes is 5mm (±1mm).
11. After completion of servicing refer to Frame 34 for reference to final safety checks.
12. Complete the service record in the Rear of this book.

---

**SETTING TO FIXED OUTPUTS**

Ensure that there is a current CH demand to the boiler (e.g. the CH Switched Live is on). Ensure that there is sufficient heating load on the boiler to allow it to run at maximum rate. Wait until the boiler is at 100% then press SELECT and the following screen will be displayed.

The kW output number in the 1st line will vary depending on the maximum output of the boiler.

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
<th>Normal Operation</th>
<th>Set Flow Temp°</th>
<th>Set DHW Temp°</th>
</tr>
</thead>
</table>

Rotate KNOB clockwise until the following screen is displayed

<table>
<thead>
<tr>
<th>Ideal imax XL 320 kW</th>
<th>Set DHW Temp°</th>
<th>Out' Sensor Slope</th>
<th>State of Inputs</th>
</tr>
</thead>
</table>

Press SELECT and the following screen will be displayed

<table>
<thead>
<tr>
<th>CH Switched Live is on</th>
<th>Winter</th>
<th>Minimum</th>
<th>Press - for more</th>
</tr>
</thead>
</table>

Press + and - until the following screen is displayed.

<table>
<thead>
<tr>
<th>CH Switched Live is on</th>
<th>Minimum</th>
<th>Maximum</th>
</tr>
</thead>
</table>

Press ENTER and the boiler will go to Maximum Rate for 5 minutes. Operation will be automatically reset at the end of 5 minutes.

To set to minimum, repeat the above selecting "minimum" setting.
36 CASING REMOVAL

TO REMOVE FRONT AND SIDE PANELS

1. Refer to frame 34
2. Lift the control pod upwards to disengage. This can then be located in the raised position using the location hooks.
3. Remove the 2 securing screws from the front panel.
4. Angle the front panel forward and lift to disengage the panel and remove.
5. Slide the front side panel forward and lift to disengage from the fixing locations.
6. Slide the rear side panel forward and lift to disengage from the fixing locations.
7. Repeat steps 5 and 6 to remove the remaining side panels.
8. Re-fit in reverse order.

Note: only the two front side panels have noise dampening insulation fitted

37 REMOVAL OF BURNER MANIFOLD

1. Refer to Frames 34 & 36.
2. Remove the four nuts securing the burner hood elbow to the heat exchanger.
3. Remove the four bolts securing the burner hood elbow to the interface plate.
4. Lift the burner hood elbow and carefully clear the heat exchanger studs.
5. To Refit: Inspect the sealing gaskets for damage and replace as necessary.
6. Align the burner head elbow and engage the studs on the heat exchanger.
7. Loosely fit the four securing bolts to locate the elbow on the interface plate.
8. Loosely fit the four securing nuts to the heat exchanger studs.
9. With all fixings in position, tighten in sequence to ensure the burner hood elbow is correctly secured on the interface plate and the heat exchanger.
10. Check for any leakage on all seals.
38 BURNER REMOVAL / CLEANING OF BURNER & HEAT EXCHANGER

1. Refer to Frame 34.
2. Refer to Frames 36 & 37 for removal of burner manifold.
3. Draw the burner out of the heat exchanger.
4. The burner can be cleaned using compressed air or a vacuum. The metal fibre outer surface must not be brushed. If the burner is showing signs of damage it must be replaced.
5. Re-assemble in reverse order replacing any seals/gaskets which show signs of wear. When refitting, ensure the burner is correctly engaged so the burner flange fits flush into the recess.
6. Refer to Frame 34 for final safety checks.

With the burner removed the heat exchanger may now be cleaned. To remove any debris flush the heat exchanger with water, if possible from a pressurised supply, taking care to protect any electrical components against moisture. Ensure the heat exchanger is fully flushed.
39 IGNITION / DETECTION ELECTRODE TESTING / REPLACEMENT

Refer to Frame 34 & 36.

IGNITION PROBE
1. Disconnect the lead from the spark generator and the earth lead from the ignition probe assembly.
2. Remove the two nuts securing the ignition probe assembly.
3. Withdraw the probe assembly carefully.
4. To refit, carefully insert the probe assembly engaging the securing stud.
5. Replace the two nuts and tighten. Re-connect the earth lead and the spark generator lead.

IONISATION PROBE
6. Disconnect the wire from the ionisation probe. Disconnect the earth lead from the ionisation probe assembly.
7. Remove the two nuts securing the probe assembly.
8. Remove the ring tag earth connection.
9. Withdraw the probe assembly carefully.
10. To replace, carefully insert the probe assembly into the heat exchanger engaging the securing studs. Re-fit the ring tag earth connection. Replace the securing nuts and tighten. Refit the earth connection and the ionisation probe lead.

SPARK GAP
The spark gap can be measured in-situ while the burner hood and burner are removed. Ensure the spark gap is 5mm (±1mm).

IONISATION
The ionisation current should be checked at min and max rate compared to the table below.

<table>
<thead>
<tr>
<th>Max Rate</th>
<th>μA</th>
<th>&gt; 8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Min Rate</td>
<td>μA</td>
<td>&gt; 10</td>
</tr>
</tbody>
</table>

40 GAS VALVE FILTER REPLACEMENT

1. Refer to Frame 34 & 36.
2. Ensure the boiler is drained
3. Remove the two hex head screws at the bottom of the inlet side of the gas valve.
4. Remove the location section of the body.
5.Withdraw the gas valve inlet filter.
6. Examine and replace as necessary.
7. Refit in reverse order.
41 INSPECTING & CLEANING THE SUMP

1. Refer to Frame 34 & 36.
2. Remove the inspection cover which is secured with eight bolts.
3. Remove any debris and flush with water if necessary.
4. To re-fit the sump inspection panel inspect the o-ring seal for damage and replace if necessary.
5. Align the sump inspection cover and secure with the 8 bolts.

42 CLEANING CONDENSATE TRAP

1. Refer to Frame 34.
2. Unscrew the top fitting of the condensate trap.
3. Unscrew the fitting at the flue outlet drain point.
4. Unscrew the condensate outlet fitting.
5. Unscrew bracket and remove trap
6. Unscrew the base of the trap and drain into a bucket.
7. Remove all debris, flushing with water if necessary.
8. Re-fit the base of the trap.
9. Re-fit in reverse order.
10. Pour water into the flue sample point to ensure the condense trap is re-filled before the unit is operated after servicing.
43 REMOVAL OF FAN AND GAS VALVE ASSEMBLY

Refer to Frame 36.
Remove Air inlet duct. Refer to Frame 50.

REMOVAL OF GAS VALVE
Refer to Frame 34.
1. Disconnect all electrical connections from the fan and gas valve.
2. Disconnect all air pipe connections from the fan and gas valve.
3. Disconnect the gas valve from the gas supply pipe by removing the two rear hex head screws and loosening the two front screws at the RHS of the gas valve.
4. Remove the four nuts which retain the burner hood elbow to the heat exchanger.
5. Remove the four bolts to release the burner hood elbow from the interface plate.
6. Slide the fan and gas valve assembly forward on the interface plate.
7. Remove the three nuts retaining the gas valve assembly to the fan scroll and remove the gas valve assembly (taking care due to the weight of the gas valve).

8. Remove the four screws retaining the gas valve to the mounting flange.
9. Fit the replacement valve in reverse. Refer to Frame 34.

REMOVAL OF FAN
With the gas valve removed the fan can now be removed.
10. Remove the air mixer collector by sliding it off the 3 threaded rods.
11. Slacken the two rear bolts securing the fan to the interface plate and remove the front two bolts.
12. With the interface plate partially retracted, lift the fan to release from the plate and withdraw, ensuring the motor casing does not clash with the chassis.
13. Fit the replacement fan in reverse order, ensuring the fan is pushed fully home to support the weight. Refer to Frame 34.
### 44 WATER PRESSURE SWITCH REPLACEMENT

1. Refer to Frames 34 & 36.
2. Ensure the boiler is drained down.
3. Disconnect the two wires.
4. Using a suitable size spanner on the hexagon undo the water pressure switch and remove.
5. Refit in reverse order using a suitable sealing medium.
6. Refit and vent check the water pressure switch connection for leaks.
7. Minimum system pressure is 1.0bar. 1.5bar is the recommended fill pressure.

### 45 THERMISTOR (X3) REPLACEMENT

1. Refer to Frames 34 & 36.
2. Disconnect the 2 wires from each thermistor.
3. Using a suitable sized spanner on the hexagon undo the thermistor and remove.
4. Refit in reverse order using a suitable sealing medium.
5. Refit and vent check the thermistor for leaks.
6. Minimum system pressure is 1.0bar. 1.5bar is the recommended fill pressure.

### 46 SPARK GENERATOR REPLACEMENT

1. Refer to Frames 34 & 36.
2. Disconnect the spark generator lead from the ignition probe.
3. Disconnect the electrical supply plug.
4. Remove the two securing screws and remove the spark generator.
5. Refit in reverse order ensuring the earth lead is correctly secured.
47 BOILER CONTROL PCB REPLACEMENT
1. Refer to Frames 34 & 36.
2. Remove all PCB electrical connections.
3. Remove the PCB carefully by pulling gently towards you at each mounting point.
4. Release the PCB from the mounting posts carefully and remove.
5. To refit, align the PCB with the mounting posts and push the PCB carefully to engage the mounting posts.
6. Refit the connectors relating to the wiring diagram in Frame 18.

48 USER INTERFACE REPLACEMENT
1. Refer to Frames 34 & 36.
2. Remove two nuts securing the rear cover of the user interface.
3. Remove the four screws securing the user interface to the front control pod and remove the assembly from the front of the control pod.
4. Refit in reverse order.
49 CONDENSATE TRAP REPLACEMENT

1. Refer to Frame 34.
2. Unscrew the top fitting of the condensate trap.
3. Unscrew the fitting at the flue outlet drain point.
4. Unscrew the condensate outlet fitting.
5. Remove the two screws holding the white retaining bracket and remove.
6. Replace condensate trap as required.
7. Re-fit in reverse order.
8. Pour water into the heat exchanger to ensure the condensate trap is re-filled before the unit is operated after servicing.

50 FLEXIBLE AIR DUCT REPLACEMENT

1. Refer to Frames 34 & 36.
2. Slacken the hose clip on the flexible duct at the fan inlet.
3. Slacken the hose clip on the flexible duct at the air inlet.
4. Carefully remove the flexible duct and hose clips.
5. To refit: Check the flexible duct for damage and replace as necessary.
6. Position the flexible duct over the air inlet and secure with the hose clip.
7. Position the flexible duct over the fan inlet and secure with the hose clip.
51 HIGH VOLTAGE HARNESS REPLACEMENT

1. Refer to Frames 34 & 36.
2. Remove the mains connection from the following spark generator, fan and gas valve.
3. Disconnect the harness from the ionisation assembly lead.
4. Unclip the harness tracing the route back to the control box.
5. Remove the connectors from the PCB.
6. Remove the three bottom connectors on LHS of control box.
7. Remove the earth post nut and release the earth connections.
8. Feed the harness through the control box and remove.
9. To refit feed the new harness through the control box.
10. Fit the three bottom connections and the PCB connectors.
11. Fit the earth wires and secure with the nut.
12. Feed the harness back to the components listed above. Use clips to retain in position and connect.
52 LOW VOLTAGE HARNESS REPLACEMENT

1. Refer to Frames 34 & 36.
2. Remove the connections from the two air pressure switches.
3. Remove the connections from the three Thermistors.
4. Remove the connections from the Water Pressure Switch.
5. Remove the connectors from the PCB.
6. Remove the top two connectors on LHS of control box.
7. Feed the harness back through the control box and remove.
8. To refit, feed the new harness through the control box and fit the top two LHS connectors.
9. Feed the harness back to the components listed above using the retaining clips and connect.

53 REPLACEMENT OF AIR PRESSURE SWITCH TUBES

1. Refer to Frames 34 & 36.
2. Disconnect the two tubes from the faulty APS.
3. Disconnect the electrical connections from the faulty APS, taking note of their positions.
4. Unscrew the APS from the bracket.
5. Replace faulty APS with new component. If variable APS is being replaced, ensure switching pressure is set for correct boiler size as per table shown.
6. Re-connect tubes and electrical connections, ensuring pipes are fitted the same as diagram shown.

**IMAX XTRA EL - Installation & Servicing**
55 OVERHEAT LOCKOUT

Has PCB just been replaced?  
yes → Reset Boiler  
no → Are the boiler and CH/DHW system filled with water and are all isolation valves and radiator valves open?  
no → Fill and vent the system and open all isolation valves, then reset the boiler.  
yes → Is the flow/return differential across the boiler in excess of 35°C?  
no → Check the flow and return thermistors (refer to Frame 61)  
yes → Check that the pump is rotating freely. Is the differential now below 20°C?  
no → Replace the pump, then reset the boiler  
yes → Reset the boiler

56 IGNITION LOCKOUT

If the boiler is reset, does it ignite for a short time and then extinguish?  
yes → Check the detection electrode and associated harness for continuity, visual condition and position (refer to Frame 42). Check if the condensate pipe is blocked.  
no → Is the dynamic gas pressure available at the boiler > 15mbar?  
no → Check gas supply and rectify fault  
yes → Is the following voltage available at the Gas Valve? approximately 240Vac  
no → Check wiring from Gas Valve to PCB and replace if necessary, otherwise replace the main PCB  
yes → Unplug the Gas Valve, is the resistance between the outside pins between 9-10MΩ?  
no → Replace Gas Valve  
yes → Check Spark Generator and associated Harness for continuity, visual condition and position (refer to Frame 46). Are these functioning correctly?  
no → Replace Spark Generator and Harness as necessary  
yes → Check Ignition Electrode and associated Harness for continuity, visual condition and position (refer to Frame 42). Are these functioning correctly?  
no → Replace Ignition Electrode and associated Harness as necessary  
yes → Check Syphon and condensate drain pipework for blockage and rectify if necessary. Boiler now working OK?  
no → Replace Gas Valve
57 FALSE FLAME LOCKOUT / ERROR 20

Reset the boiler, does boiler work OK?

- Yes: Check routing and integrity of internal boiler wiring is OK. Check condition of Flame Sense Electrode and replace if deteriorated.
- No:
  - Yes: Replace Flame Detection Electrode
  - No: Check routing and integrity of internal boiler wiring

58 LOW WATER PRESSURE / AIR PRESSURE SWITCH / BLOCKED CONDENSATE

Are the boiler and CH system filled with water to 1.0 bar and all Isolation and Radiator Valves open?

- No: Fill and vent the system and open all Isolation Valves
- Yes:
  - No: Disconnect the electrical connection to the Flame Sense Electrode. Is there continuity between the Electrode and earth?
  - Yes:
    - Yes: Replace Flame Detection Electrode
    - No: Check routing and integrity of internal boiler wiring

Does the black wire from the Water Pressure Switch to the PCB have continuity and is it securely connected?

- No: Ensure wiring has continuity and is securely connected
- Yes:
  - Yes: Clear blockage and check boiler operates
  - No: Replace any damaged tubes / remove water or reconnect

Check syphon and condensate drain Pipework for blockage. Is there a blockage?

- Yes: Clear blockage and test boiler is operating ok.
- No:
  - Yes: Replace any damaged tubes / remove water or reconnect
  - No:
    - Yes: Ensure wiring has continuity and is securely connected
    - No: Check routing and integrity of internal boiler wiring

Check air pressure tubes are fitted correctly and not retaining water. Are they damaged / kinked?

- Yes: Replace any damaged tubes / remove water or reconnect
- No:
  - Yes: Ensure wiring has continuity and is securely connected
  - No: Check routing and integrity of internal boiler wiring

Is the APS connected to sump and is sump set to correct value 320kW-200Pa, 395kW-200Pa, 470kW-300Pa, 545kW-300Pa, 620kW-400Pa

- Yes: Connect all terminals using wiring diagram in this manual
- No:
  - Yes: Replace any damaged tubes / remove water or reconnect
  - No: Redesign flue to ensure >-10Pa and <100Pa

Are all electrical connections in place and on correct terminal?

- Yes: Clear blockage and test boiler is operating ok.
- No:
  - Yes: Replace any damaged tubes / remove water or reconnect
  - No: Redesign flue to ensure >-10Pa and <100Pa

Is flue resistance is >-10Pa and <100Pa when operating at max heat input?

- Yes: Clear blockage and test boiler is operating ok.
- No:
  - Yes: Replace any damaged tubes / remove water or reconnect
  - No: Redesign flue to ensure >-10Pa and <100Pa

Is the flue blocked or restricted?

- Yes: Clear blockage and test boiler is operating ok.
- No:
  - Yes: Replace any damaged tubes / remove water or reconnect
  - No: Redesign flue to ensure >-10Pa and <100Pa

Is Air inlet restricted or blocked?

- Yes: Clear blockage and test boiler is operating ok.
- No:
  - Yes: Replace any damaged tubes / remove water or reconnect
  - No: Redesign flue to ensure >-10Pa and <100Pa

If optional filter is fitted, check this is not blocked.
59 FLAME LOSS

If the boiler is Reset, does the boiler Ignite for a short time and then Extinguish

- yes
- no

Is the Gas Pressure available at the boiler > 15mbar?

- yes
- no

Is the following voltage available at the Gas Valve? (approximately 240Vac)

- yes
- no

Check Spark Generator and associated Harness for continuity, visual condition and position (refer to Frame 46). Are these functioning correctly?

- yes
- no

Check Ignition Electrode and associated Harness for continuity, visual condition and position (refer to Frame 42). Are these functioning correctly?

- yes
- no

Check Syphon and condensate drain pipework for blockage and rectify if necessary. Boiler now working OK?

- yes
- no

60 FAN FAULT

Does the wiring from the Fan to the PCB have secure connections at both ends and has it not deteriorated? Does the wiring have continuity?

- yes
- no

Is there 230Vac at the blue and brown connections to the 3 way connection on the Fan?

- yes
- no

Rectify wiring & connections

Replace main PCB

Replace Fan
**FAULT FINDING**

### 61 THERMISTOR FAULT

Disconnect the electrical connection to the Flow/Return/Heat Exchanger thermistor as required and check the resistance using a suitable multimeter connected across the thermistor's terminal pins.

- At 25°C expect 9,700 - 10,300 Ω
- At 60°C expect 2,400 - 2,600 Ω
- At 85°C expect 1,000 - 1,100 Ω

Is the thermistor value correct?

- **yes**
  - Is there continuity between the PCB and the thermistor?
    - **yes** Replace main PCB
    - **no** Check and replace wiring as necessary

- **no** Fit a new thermistor

### 62 OUTSIDE SENSOR FAULT

Is the wiring securely connected at both the boiler and Outside Sensor?

- **no** Securely connect the wiring at both the boiler and Outside Sensor

- **yes**
  - Disconnect the wires to the Outside Sensor. Check the resistance using a suitable multimeter connected across the thermistor’s terminal pins.
    - At 0°C expect 32,000 - 33,000 Ω
    - At 10°C expect 19,000 - 21,000 Ω
    - At 20°C expect 12,000 - 13,000 Ω

Is the thermistor value correct?

- **yes**
  - Does the Outside Sensor wiring between the boiler terminal strip and the PCB have continuity and is it securely connected?
    - **yes** Replace main PCB
    - **no** Ensure the wiring has continuity and is securely connected

- **no** Fit a new Outside Sensor
63 FLOW/RETURN REVERSED

Is the Pump connected the correct way? no → Reverse Pump
yes → Check that the system pipework is correct

64 CYLINDER THERMISTOR FAULT

Is a DHW Thermistor connected to the boiler? no → Change menu setting for DHW Sensor to “Switched Live” (See Frame 26)
yes → Is the wiring securely connected at both the boiler and cylinder thermistor? no → Securely connect the wiring at both the boiler and cylinder thermistor
yes → Disconnect the wires to the cylinder thermistor. Check the resistance using a suitable multimeter connected across the thermistor’s terminal pins.
At 25°C expect 9,700 - 10,300 Ω
At 60°C expect 2,400 - 2,600 Ω
At 85°C expect 1,000 - 1,100 Ω
Is the thermistor value correct? no → Ensure the wiring has continuity and is securely connected
yes → Does the cylinder thermistor wiring between the boiler terminal strip and the PCB have continuity and is it securely connected? yes → Replace main PCB
no → Fit a new cylinder thermistor

65 BCC FAULT

Is the correct BCC for the boiler securely inserted into the slot at the front left of the PCB? no → Securely attach the correct BCC for the boiler onto the PCB. Note: ensure the correct orientation of the BCC by placing the side marked “TOP” upwards.
(identified by the label on the BCC)
yes → Replace the BCC with a new BCC (that is correct for the boiler). After switching power on and resetting the boiler does the fault disappear? yes → Replace main PCB
no →
66  NO CH BUT DHW OK

Is the boiler set for Winter operation?
no → Set for Winter operation (see Frame 21)
yes →

Are the external controls calling for Heat?
no → Ensure that the Timer and Room Thermostat are calling for heat
yes →

Are the Radiator Valves open?
no → Open the Radiator Valves
yes →

Is an OpenTherm device connected to the boiler (note that the Ideal Prog Room Stat is an OpenTherm device)?
no → Does the wiring from the boiler to the OpenTherm device have continuity?
yes →

There is no voltage from the external controls. This is not a boiler fault. Ensure voltage is supplied to the boiler by correcting external wiring
no → Rectify wiring from boiler to OpenTherm device
yes →

Is there 230Vac at (A)?
no → Check wiring from PCB to (B)
yes →

Does wiring to external CH Pump have continuity and is wired to the correct connections?
no → Rectify wiring to external CH pump
yes →

Is the CH pump stuck
no → Replace the CH pump
yes → Free the pump

All Mains Voltages are measured between the test point and neutral

---

IMAX XTRA EL - Installation & Servicing
**67 NO DHW BUT CH OK**

- **Are the Timer and Cylinder Thermostat/Thermistor calling for Heat?**
  - **yes**
  - **no**

- **Is an OpenTherm device connected to the boiler (note that the ideal programmable Room Stat is an OpenTherm device)?**
  - **yes**
  - **no**

- **Is there 230Vac at (C)?**
  - **yes**
  - **no**

**Does the system have a DHW Pump or Power Open Diverter Valve?**

- **yes**
- **no**

**Is the boiler correctly set for a DHW Pump or Power Open Diverter Valve?**

- **yes**
- **no**

**Is there 230Vac at (D)?**

- **yes**
- **no**

- **Does wiring to external DHW Pump have continuity and is it wired to the correct connections?**
  - **yes**
  - **no**

**Is the boiler set for DHW priority (default setting)?**

- **yes**
- **no**

**Is the DHW Pump/Valve stuck?**

- **yes**
- **no**

**Ensure that the Timer and Cylinder Stat/Thermistor are calling for heat (if a DHW Thermistor is used see Frame 26 for setting DHW Temp.).**

**Does the wiring from the boiler to the OpenTherm device have continuity?**

- **yes**
- **no**

- **There is no voltage from the Timer/Cylinder Stat. This is not a boiler fault. Ensure voltage is supplied to the boiler by correcting external wiring.**

- **Rectify wiring from boiler to OpenTherm device**

**Is the system correctly set for a Power Closed Diverter Valve?**

- **yes**
- **no**

- **Set boiler correctly (See page 25)**

**Check wiring from PCB to (D)**

**Rectify wiring to external DHW pump/valve**

**Set boiler for DHW priority (see Frame 25)**

**Replace the DHW pump/valve**

- **Free the pump/valve**

---

**All Mains Voltages are measured between the test point and neutral**

---

**IMAX XTRA EL - Installation & Servicing**
68 NO DISPLAY

Is there 230Vac to the boiler at (E)?

- yes, Supply power to the boiler
- no, Connect the wiring from the terminal block to the main PCB securely

Is the wiring from the boiler terminal block to the main PCB connected securely?

- yes, Connect the wiring from the terminal block to the main PCB securely
- no, Check for shorts on Pumps/Diverter Valve/Fan/Spark Generator/Gas Valve and replace Fuse

Is the Fuse on the main PCB OK?

- yes, Connect the cable from the main PCB to the user interface PCB securely
- no, Replace cable from main PCB to user interface PCB

Is the cable from the main PCB to the user interface PCB connected securely?

- yes, Replace cable from main PCB to user interface PCB
- no, Replace the user interface PCB, still no display?

Replace the user interface PCB, still no display?

- yes, Replace main PCB
- no, Connect the cable from the main PCB to the user interface PCB securely

All Mains Voltages are measured between the test point and neutral.
**69 0-10V INTERFACE**

Is the boiler set to accept a 0-10V Input?  
- **Yes**  
  Set the boiler to accept a 0-10V input (see Frame 23)

Is the boiler set to Winter Mode?  
- **Yes**  
  Set the boiler to Winter Mode (see Frame 21)

Is a voltage of between 2V and 10V being supplied to (F), with positive and negative connected correctly?  
- **Yes**  
  Ensure between 2V and 10V is correctly connected to these terminals from the external device

Is the wiring from the boiler terminal strip to the main PCB securely connected and does it have continuity?  
- **Yes**  
  Replace main PCB

**70 EXTERNAL INTERLOCK OFF**

Is an External Interlock connected to the boiler?  
- **No**  
  Ensure that a link wire is securely connected across the terminals marked “External Interlock” in the boiler terminal strip

Has the External Interlock operated?  
- **Yes**  
  Reset the External Interlock

- **No**  
  Ensure the wiring has continuity and is securely connected

Does the wiring from the Interlock Relay (mounted within the boiler) to the terminal strip have continuity and is it securely connected?  
- **No**  
  Replace the Interlock Relay Kit
SPARE PARTS

When replacing any part on this appliance use only spare parts that you can be assured conform to the safety and performance specification that we require. Do not use reconditioned or copy parts that have not been clearly authorised by Ideal. Failure to do so could affect safety or performance of this appliance.

Comprehensive spares parts information and details of approved Ideal Parts Distributors are available on www.idealparts.com.

Our Parts team are also available to help with your Ideal Spare Parts enquiries on 01482 498665.

When calling, and to ensure we can provide you with the most accurate parts information, please ensure you have the following to hand;

- Boiler Model
- Boiler Serial Number

It is recommended that your heating system is serviced regularly and that the appropriate Service Interval Record is completed.

Service Provider

Before completing the appropriate Service Record below, please ensure you have carried out the service as described in the manufacturer’s instructions. Always use the manufacturer’s specified spare part when replacing controls.
